New peptide antagonist of zonulin useful as antiinflammatory agent for

```
CC (2), one of 25 such peptides (see Y99105-29) of the invention, CC (2), one of 25 such peptides (see Y99105-29) of the invention, CC which bind to a zonula occludents toxin (ZOT) receptor, yet do not (CC physiologically modulate the opening of mammalian tight junctions and human zonulins, which is believed to be critical for receptor compliant DNA techniques. The peptide antagonists are used as an inflammation, where they bind to the ZOT receptor in the intestinal conditions of physiologically modulate the opening of Tyin the conditions diverted by chemical synthesis or by use of and yet does not physiologically modulate the opening of Tyin the confidence intestine. Gastrointestinal inflammation conditions give rise to treating intestinal permeability and the peptide is useful for caused by infection, e.g. Clostridium difficule infection, confictions that cause protein losing enteropathy confidence infestinal conditions that cause protein losing enteropathy confidence infestion, bacterial overgrowth, whipple's disease, diseases with collapse of confidence infestinal inflammatory bowel disease, diseases with confidence correction of congenital heart disease with Fontan's operation, collapse collapse symphoma, mesenteric tuberculosis, and after surgical concerculated disease, each opening or fond allowance disease, collapses each operation, e.g. Menetries' disease, collapses, each opening or fond allowance diseases, collapses, each opening or fond allowance diseases, collapses, each opening or fond allowance diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

This present sequence is that of a peptide antagonist of zonulin CC (2), one of 25 such peptides (see Y79105-29) of the invention, CC which bind to a zonula occludens toxin (ZOT) receptor, yet do not CC physiologically modulate the opening of mammalian tight junctions CC and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC antiling. They can be prepared by chemical synthesis or by use of CC antiling. They can be prepared by chemical synthesis or by use of CC inflammation, where they bind to the zor receptor in the intestinal CC inflammation, where they bind to the zor receptor in the intestine CC intestine. Gastrointestinal inflammation conditions give rise to CC increased intestinal permeability and the peptide is useful for CC caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite collits, shigellosis, viral gastroenteritis, parasite collits, shigellosis, viral gastroenteritis, parasite collits, inflammatory bowel disease, diseases with collegenous collits, inflammatory bowel disease, diseases with collegenous collits, inflammatory bowel disease, diseases marked by sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, c.g. septimized and after surgical correction disease, without ulceration, e.g. Menettrier's disease, e.g. gastroenteritis, and immune diseases, c.g. e.g. systemic lupus erythematosus or food allergies, primarily to

The humanised antibodies can be used in diagnosis, imaging and therapy of CEA-producing cancers and patients receiving the humanised antibodies and conjugates show improved therapeutic results, decreased immune responses and decreased immune-mediated adverse effects compared to the parent antibody. See R97313-97333 for the CDR sequence and framework

The present invention describes fusion proteins comprising a chemokine and a tumour antigen or HIV antigen. Specifically claimed fusion proteins comprise: (1) human monocyte chemotactic protein-3 (MCP-3) and human Muc-1; (2) human interferon induced protein 10 (IP-10) and human Muc-1; (3) human macrophage-derived chemokine (MCD) and human Muc-1; (4) human SDF-1 and human MCP-3 and SDF-1 and human MCP-3 and HIV gpl20; (7) human MCD and HIV gpl20; and (8) human SDF-1 and HIV 9pl20. The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response, e.g. an effector T cell immune response. They can also be used for treating cancer or treating or preventing HIV infection. The fusion proteins and/or nucleotide sequences can be used in in vitro diagnostic assays, as well as in screening assays for identifying unknown tumour antigen epitopes and fine mapping of tumour antigen epitopes. The present sequence represents a specifically claimed fusion protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The present invention describes fusion proteins comprising a chemokine and a tumour antigen or HIV antigen. Specifically claimed fusion proteins comprise: (1) human monocyte chemotactic protein 3 (MCP-3) and human Muc-1; (2) human interferon induced protein 10 (IP-10) and human Muc-1; (3) human macrophage-derived chemokine (MDC) and human Muc-1; (4) human SDF-1 and human Muc-1; (5) human IT-10 and HIV 99120; (6) human MCP-3 and HIV 99120; (7) human MCP-3 and display and (8) human SDF-1 and HIV 99120. The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response, eg. an effector T cell immune response. They can also be used for treating cancer or treating or preventing HIV infection. The fusion proteins and/or nucleotide sequences for identifying unknown tumour antigen epitopes and fine mapping of the function antitone who proceeds a well as in screening assays for identifying unknown tumour antigen epitopes and fine mapping of
                                                                                                                                                                                                                                       Claim 73; Page 136; 142pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human SDF-1 and human scFV fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to coding sequences (see F44740-F44840 and F44843-F44844) and proteins (see B65714-B65814) involved in programmed cell death (PCD; apoptosis). The coding sequences and proteins of the present invention are useful for modulating a PCD or cell death pathway incorporating one of the pathways in a forestry plant, by stably incorporating one of the present coding sequences into the genome of the forestry plant, where the coding sequence provides a PCD pathway that is not present in a native form of the forestry plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chemokine; tumour; viral; antige

CC The present invention describes fusion proteins comprising a chemokine CC and a tumour antigen or HIV antigen. Specifically claimed fusion proteins CC comprise: (1) human monocyte chemotactic protein 3 (MCP-3) and human CC (1; (2) human interferon induced protein 10 (IP-10) and human Muc-1; (2) human macrophage-derived chemokine (MDC) and human Muc-1; (4) human SDF-1 and HIV gp120; (6) human MCP-3 and CC HIV gp120; (7) human MDC and HIV gp120; and (8) human SDF-1 and HIV gp120. The fusion proteins, and nucleotide sequences encoding them, can CC gp120. The fusion proteins, and nucleotide sequences encoding them, can CC be used for producing an immune response, e.g. an effector T cell immune CC response. They can also be used for treating cancer or treating or CC preventing HIV infection. The fusion proteins and/or nucleotide sequences CC can be used in in vitro diagnostic assays, as well as in screening assays CC identifying unknown tumour antigen epitopes and fine mapping of CC tumour antigen epitopes. The present sequence represents a specifically XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT

The peptide antagonists are based on a common motif of 207 cand human zonulins, which is believed to be critical for receptor combinant DNA techniques. The peptide antagonists are used as an canding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an candinant DNA techniques. The peptide antagonists are used as an candinant DNA techniques. The peptide antagonists are used as an candinant DNA techniques. The peptide antagonists are used as an candinant peptide in the intestinal conditions of the intestinal conditions of the peptide is useful for cances of intestinal conditions that cause protein losing enteropathy conseed by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile infection, cancer, concertain or ulcerations, viral gastroenteritis, parasite collets, shigellosis, viral gastroenteritis, parasite collegeous collits, shigellosis, viral gastroenteritis, parasite collegeous collits, inflammatory bowel disease, diseases with concertain correction of congenital heart disease with frontan's operation, concertain conc

                                 The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immunogenicity of the protein when exposed to the immunogenicity of the protein when exposed to the immunogenic the protein of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducting the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products can be used for diagnosis and therapy. Sequences W86075-W86114 represent peptides from humanised A33 heavy chain variable region predicted by
                                                                                                                                                                                                                                                               Reducing immunogenicity sequence of the protein of a given species
                                                                                                                                                                                                                                      Example 5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given one of the T-cell epitopes identified in step (b) thereby to eliminate at least reduce the immunogenicity of the protein when exposed to the immune to predict the basis for immunogenic responses is also provided. The immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products can be used particularly for reducing the immunogenicity of can be used for diagnosis and therapy. Sequences w86075-w86114 represent neptides from humanised A33 heavy chain variable region predicted by
                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  14-APR-1998;

                                                                                                                                                                                                                                                                                                                           The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune protein when exposed to the immune to predict the basis for immunogenic responses is also provided. The immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products can be used particularly for reducing the immunogenicity of can be used for diagnosis and therapy. Sequences w86075-w86114 represent peptides from humanised A33 heavy chain variable region predicted by
                           IgG heavy chain fragment, IgG (VH) (18).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a fragment of the IgG heavy chain. This sequence was isolated using the biomedical device of the invention, which comprises: (a) a biocompatible support; and (b) conglutinin which is covalently bound to the support. The device can be used for removing immune complexes (IC) from a fluid. This can be used for treating a mammal or for evaluating the status of a mammal. It can be used for treating diseases such as serum sickness, chronic immune complex nephritis, bacterial infections, viral infections, parasitic diseases, autoimmune diseases or neoplastic diseases. The devices can also be used for purification of IC and to study immune pathogenesis and antigens associated with a disease state. The covalently immobilised conglutinin can capture IC with high capacity and specificity and allows elution under mild conditions. The devices are stable with no loss of IC binding
                                                                                                                                 Antibody; human; influenza type A virus; HlN1; H2N2; H3N2; HA; diagnosis; haemagglutinin; variable light chain; therapy; CDR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     R82833 and R82834 represent the N-terminal sequences of the heavy chain CC and light chain of an anti-human influenza A type virus antibody. The antibody these sequences were obtained from was isolated from hybridoma CC C179. The antibody recognises the stem region of the haemagglutinin (HA) CC molecule of the H1N1 and H2N2 subtypes of human influenza A type virus, CC and shows neutralisation activity against these two subtypes. The CC antibody shows no recognition of the H3N2 subtype. The DNA encoding the CC variable heavy chain sequence (see T04159) and the variable light chain CC coding sequence (see T04150) are useful in the production of artificial CC coding sequence (see T04160) are useful in the production of artificial CC coding sequence (see T04150) are useful in the diagnosis and treatment of human CC influenza. As the antibodies recognise the stem region of the HA cC conject. This provides an advantage over current vaccines, as the virus company of the that the provides and advantage over current vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                 The present sequence is that of the N-terminal region of adult human heart zonulin. The N-terminal sequences of human adult and foetal zonulins (see Y79130-36) were compared with Vibrio cholerae zonula occludens toxin (20T) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-brain

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 6
D31485
Ig heavy chain V regions (3-24 and 5-14) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Apecies: Mus musculus (house mouse)
C;Accession: D31485
R;Bedzyk, W.D.; Johnson, L.S.; Riordan, G.S.; Voss Jr., E.W.
J. Biol. Chem. 264, 1565-1569, 1989
A;Title: Comparison of variable region primary structures within an anti-fluore A;Reference number: A31485; MUID:89109167
A;Retous: preliminary
A;Molecule type: protein
A;Residues: 1-36 <BED>
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
                                                                                                                                                                                                                                                                                       Ig heavy chain V region - mouse (fragment)
C:Species: Mus musculus (house mouse)
C:Date: 19-Mar-1997 #sequence_revision 24-Jul-1997
C:Accession: $33402; $356385

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc recognised by both anti-tau polyclonal antibody and by anti-zonula cc occludens toxin (ZOT) polyclonal antibody, and is capable of reversibly cc opening mammalian tight junctions. Zonulin proteins function as copening mammalian tight junctions. Zonulin proteins function as cc opening mammalian tight junctions. They can be used for enhancing the absorption of therapeutic agents across tight cc for enhancing the absorption of therapeutic agents across tight junctions of the blood brain barrier. Zonulin can be used with agents such as drugs, cc e.g. lidocaine, adenosine, dobutamine, dopamine, epinephrine, cc norepinephrine, phentolamine, doxapram, alfentanil, dezocin, nalbuphine, cc mivacurium, succinylcholine, cytarabine, mitomycin doxorubicin, cc mivacurium, succinylcholine, cytarabine, mitomycin doxorubicin, cc etoxitin, cefenicid, cefentazole and aztreonam, a hormone e.g. cc interferon-alpha, interferon-beta, interferon-gamma, interleukin-1 cc (IL-1), IL-2, IL-4, IL-8, polyvalent IgG, specific IgG, IgA, or IgM. cc be used to assay for zonulin in body tissue or fluids, or in affinity-purification of zonulin. The present sequence represents an N-terminal xxx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                           New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
            Example
                                                                                              WPI; 2000-205565/18

                       Framework regions (R87049-52) of human group III (gp3) germ line antibody heavy chain showed homology to corresponding regions (R87053-56, respectively) of the rat anti-human interleukin-5 monoclonal antibody 39D10 heavy chain (see R87039). This homology was utilised in the prodn. of a humanised 39D10 vH (R87058) in which rat 39D10 vH complementarity determining regions were grafted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of the N-terminal region of adult human heart zonulin. The N-terminal sequences of human adult and foetal zonulins (see Y9130-36) were compared with Vibrio cholerae zonula occludens toxin (ZOT) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    25-JUN-1996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

The invention also includes antigen binding portions that bind to II-12. Sequences B39485-B39516 represent human anti-II-12 antibody heavy and light chain complementarity determining region (CDR) amino acid sequences, and also includes variable region amino acid sequences. Other variable region amino acid sequences are given in B39517-B39560 and B40068-B40149. Sequences B39561-B39771 represent anti-II-12 CDR3 related amino acid sequences, B39772-B40063 represent other CDR sequences. Light chain CDR3 consensus sequences are given in B40064-B40067. Primers used in the identification and construction of the antibodies of the invention are given in C61062-C61071. The antibody of the invention is a neutralising antibody and has antirheumatic; antiarthritic; antisticutation and construction and construction of the antibodies of the invention are given in C61062-C61071. The antibody of the invention is a neutralising antibody and has antirheumatic; antiarthritic; antisticutation.

                             The sequence is that of the heavy chain DP-51 derived from the germline human VH gene DP-51 (from the VH3 family Tomlinson et al 1992) of antibody fragments binding to human TNF. It may be used as part of a method of producing chimeric mouse-human antibodies or fragments which have the same binding specificity as a parent Ab but have increased human characteristics, preventing anti-glob

Modification of a rodent antibody (Ab) or fragment by resurfacing in order to produce a humanised rodent Ab can be determined by calculating homology between murine and human Ab antibody surfaces. In order to test were set up: (1) traditional loop grafting; (2) resurfacing approach sequences with most similar chain, and (3) resurfacing approach using human anti-N901 Ab (see R52061). Experiment 3 was carried out using the present with 74 percent homology with anti-N901 Ab (see R52061). Experiment 3 was carried out using the present with 74 percent homology with anti-N901 Ab. N901/PtO123 (R52067) was prepled. by resurfacing. Sequence numbering starts at position 118 in
                                                                                                                                                                                                Method of resurfacing of rodent antibodies to produce humanised antibody forms - for producing non-human antibodies with improved therapeutic efficiency by presenting human surface on V-region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                               Ş
                                                                                                                                                                                                             This is the heavy chain amino acid sequence of germline (GL) pp58 antibody. The invention relates to the construction and use of human MADs specific for the fusion (F) protein of respiratory c syncytial virus (RSV) to passively treat, prevent or detect RSV infection. Hul9A, Hul9B, Hul9C and Hul9D MADs are claimed. These are reshaped human antibodies comprising a heavy chain selected from 19A, 19B, 19C or 19D (see W59615-18), which are based on the GL Dp58 sequence, and a light chain selected from 19A, 19B, 19C or 19D (see W59620-21). Such engineered antibodies are neutralising; they inhibit virus growth in viror and in vivo in animal models of RSV infection. Nucleic acids endough the human MADs, recombinant plasmids (see V41427-33) and host cells (e.g. COS, CHO, myeloma) or are provided.
                                                                                                                                         Query Match

CC This invention relates to a new human antibody specific for human CC interleukin-12 (IL-12). The invention also includes antigen binding CC portions that bind to IL-12. Sequences B39485-B39516 represent human CC anti-IL-12 antibody heavy and light chain complementarity determining CC amino acid sequences. Other variable region amino acid sequences are GC qiven in B39517-B39500 and B40068-B40149. Sequences B39561-B39771 CC represent anti-IL-12 CDR3 related amino acid sequences B39772-B40063 CC represent other CDR sequences. Light chain CDR3 consensus sequences are CC given in B40064-B40067. Primers used in the identification and CC construction of the antibodies of the invention are given in CC C61062-C61071. The antibody of the invention is a neutralising antibody CC and has antirheumatic; antiarthritic; antiasthmatic; cardiant; antiparasitic; CC antibacterial and immunosuppressive activity. The antibodies or CC antiparatial detrimental release of human IL-12, especially Crohn's CC disease, multiple sclerosis and rheumatoid arthritis. They can also be CC used in the manufacture of a pharmaceutical composition to treat human CC III-19 disorders

cc region (CDR) amino acid sequences, and also includes variable region camino acid sequences. Other variable region amino acid sequences are given in B39517-B39560 and B40068 B40149. Sequences B39561-B3971 CC represent anti-II-12 CDR3 related amino acid sequences, B3972-B40063 CC represent other CDR sequences. Light chain CDR3 consensus sequences are CG given in B40064-B40067. Primers used in the identification and CC construction of the antibodies of the invention are given in CC construction antiarthritic; antiarthritic; antisclerotic; antiinflammatory; CC and has antirheumatic; antiarthritic; antisclerotic; antiinflammatory; CC neuroprotective; antipsoriatic; antiasthmatic; cardiant; antiparasitic; CC antibacterial and immunosuppressive activity. The antibodies or antibacterial and immunosuppressive activity. The antibodies or CC antiper-binding fragments are useful in the treatment of disorders associated with detrimental release of human II-12, especially Crohn's CC disease, multiple sclerosis and rheumatoid arthritis. They can also be CC used in the manufacture of a pharmaceutical composition to treat human CC II-12 disorders
                                                                                                                                  Matches
                                                                                                                                                                  Best
                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a new human antibody specific for human interleukin-12 (IL-12). The invention also includes antigen binding portions that bind to IL-12. Sequences B39485-B39516 represent human anti-IL-12 antibody heavy and light chain complementarity determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antisclerotic; neuroprotective; antiparasitic; antiabatterial; antiparasitic; antibatterial; antiparasitic; antibatterial; anunosuppressive; Crohn's disease; multiple sclerosis; rheumatoid arthritis.

                                                                                                           This invention relates to a new human antibody specific for human control interleukin-12 (IL-12). The invention also includes antigen binding the portions that bind to IL-12. Sequences B39485-B39516 represent human control in the IL-12 antibody heavy and light chain complementarity determining cregion (CDR) amino acid sequences, and also includes variable region amino acid sequences. Other variable region amino acid sequences are created in B39517-B39560 and B40068-B40149. Sequences B39561-B39771 crepresent anti-IL-12 CDR3 related amino acid sequences, B39772-B40063 crepresent other CDR sequences. Light chain CDR3 consensus sequences are created amino acid sequences are created amino acid sequences and created amino acid sequences are construction of the antibodies of the invention are given in B40064-B40067. Primers used in the identification and construction of the antibodies of the invention are given in CC construction of the antibodies of the invention is a neutralising antibody can dhas antirheumatic; antiarthritic; antisclerotic; antiarthritic; antibodies or antiporotective; antiporiatic; antiarthmatic; cardiant; antiparasitic; antiparation of the antiporiatic; antiparation of disorders castivity. The antibodies or antiporotective; antiporessive activity. The antibodies or antiporotective antiporessive activity. The antibodies or associated with detrimental release of human IL-12, especially Crohn's cused in the manufacture of a pharmaceutical composition to treat human current control of the antipoles of a pharmaceutical composition to treat human current control of the control of a pharmaceutical composition to treat human current control of a pharmaceutical composition to treat human current control of the control of a pharmaceutical composition to treat human current control of the control of a pharmaceutical composition to treat human current control of the control of a pharmaceutical composition to treat human current control of the control of a pharmaceutical composition to treat human current con

The invention also includes antigen binding controls that bind to IL-12. Sequences B39485-B39516 represent human compositions that bind to IL-12. Sequences B39485-B39516 represent human compositions that bind to IL-12. Sequences B39485-B39516 represent human complementarity determining control in complementarity determining control in complementarity determining control in CDR) amino acid sequences are sequences and also includes variable region control in B3951-B3950 and B40068-B40149. Sequences B3951-B3971 control in B3971-B3971 control in B39712-B40063 co

This invention relates to a new human antibody specific for human control interleukin-12 (IL-12). The invention also includes antigen binding comportions that bind to IL-12. Sequences B39485-B39516 represent human compositions that bind to IL-12. Sequences B39485-B39516 represent human compositions that bind to IL-12. Sequences B39485-B39516 represent human composition acid sequences are specific compositions acid sequences. Other variable region amino acid sequences are composition and sequences. Other variable region amino acid sequences are composition in B39517-B3950 and B40088-B40149. Sequences B39517-B39719 composition in B39517-B3950 and B40088-B40149. Sequences B39517-B39719 composition of the antibodies of the invention are given in B40064-B40067. Primers used in the identification and construction of the antibodies of the invention are given in B40064-B40067. Primers used in the identification and construction of the antibodies of the invention are given in B40064-B40067. Primers used in the invention are given in CC C61062-C61071. The antibody of the invention is a neutralising antibody can has antirheumatic; antiarthritic; antisclerotic; antiparasitic; cantibacterial and immunosuppressive activity. The antibodies or continuous composition are given in the invention are given in the antiparasitic; antisclerotic; antiparasitic; antibacterial and immunosuppressive activity. The antibodies or continuous distribution are given in the invention are 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (BADI )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 75; Page 121; 377pp; English

This invention relates to a new human antibody specific for human CC interleukin-12 (IL-12). The invention also includes antigen binding CC interleukin-12 (IL-12). The invention also includes antigen binding CC portions that bind to IL-12. Sequences B39485-B39516 represent human CC anti-IL-12 antibody heavy and light chain complementarity determining CC region (CDR) amino acid sequences, and also includes variable region CC amino acid sequences. Other variable region amino acid sequences are given in B39517-B39560 and B40068-B40149. Sequences B39561-B39771 CC represent anti-IL-12 CDR3 related amino acid sequences, B39772-B40063 CC qiven in B40064-B40067. Primers used in the identification and CC construction of the antibodies of the invention are given in C61062-C61071. The antibodies of the invention are given in C61062-C61071. The antibodies of the invention is a neutralising antibody CC antibacterial and immunosuppressive activity. The antibodies or associated with detrimental release of human IL-12, especially Crohn's CC disease, multiple sclerosis and rheumatoid arthritis. They can also be used in the mannifacture of a charmanounties! Commonstrian to treat human suppressive activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       QΥ
                                                                                                                                      This invention relates to a new human antibody specific for human interleukin-12 (IL-12). The invention also includes antigen binding portions that bind to IL-12. Sequences B39485-B39516 represent human anti-IL-12 antibody heavy and light chain complementarity determining region (CDR) amino acid sequences, and also includes variable region amino acid sequences other variable region amino acid sequences are given in B39517-B39560 and B40068-B40149. Sequences B3951-B39771 represent anti-IL-12 CDR3 related amino acid sequences, B3977-B40063 represent other CDR sequences. Light chain CDR3 consensus sequences given in B40064-B40067. Primers used in the identification and construction of the antibodies of the invention are given in C61062-C61071. The antibodies of the invention is a neutralising antibody and has antirheumatic; antiarthritic; antisclerotic; antinflammatory,
                                         neuroprotective; antipsoriatic; antiasthmatic; cardiant; antiparasitic; antibacterial and immunosuppressive activity. The antibodies or antiparabinding fragments are useful in the treatment of disorders associated with detrimental release of human II-12, especially Crohn's disease, multiple sclerosis and rheumatoid arthritis. They can also be used in the manufacture of a pharmaceutical composition to treat human
                                                                                                                                                                                                                                                                                                                                                                                       Claim 75; Page 121; 377pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Kaymakcalan Z, Labkovsky B, Sakora:
